Education in India

Since independence of our country, education in India has grown gradually through the efforts of central and state governments. Many factors like teaching skills, infrastructure and other indicators affects education quality. Here we try to analyze various such parameters in education system over the years and further create interactive dashboard of various charts which will help in showing insights on how our education system has improved and point out shortcomings where we can work upon to make it better. We will be using the public data captured by Ministry of Education (India). For this, we will be using Python and Pyplot to process and analyze data; HTML, CSS and JavaScript for creating interactive dashboard and git for version control of the project.
