Readme to the outlab 1 (HTML and CSS)

In this outlab we were supposed to make a webpage using HTML, CSS and some Bootstrap. I learned the most part in lab except for bootstrap (which makes the webpage responsive) which I studied from [w3school.com](https://www.w3school.com).

So I spent most of the time in reading and understanding the ways of responsive coding. I was particularly fascinated by some of the websites I visited. I loved the stationary background type and implemented it by taking help from youtube videos and [w3school.com](https://www.w3school.com) (a great website for sure!)

In this assignment I made a responsive navigation bar, read in w3school/bootstrap and implemented it with a lot of edits after taking a basic template.

I made a "carousel" from another template and edited it according to my wants as we were allowed to take help from [w3school.com](https://www.w3school.com) and it gave me great results.

Then implemented the "stationary background effect" similar to parallax effect from almost scratch. I made a table, edited the fonts and gave good css treatment, then I made a responsive table from [w3schools.com](https://www.w3schools.com)

As a lot of things were available readymade from w3school, I got a lot of help from it in understanding the way to code.

I wrote about myself, and added a lot of photos, a lot of things by using bootstrap.

citations to some websites, mostly [w3schools.com](https://www.w3schools.com), stackoverflow, google and some youtube videos.

I learned a lot from this assignment!
